

SESSION-4
MODULE-1(TASK)

1. List all 6 phases of SDLC in order with one line about each.

ANS: The 6 Phases of the SDLC (Software Development Life Cycle)

1.Planning: Phase 1.

Defining the project scope, identifying resources, calculating costs, and setting the overall schedule.

2.Requirements Analysis: Phase 2.

Gathering detailed user and technical requirements from stakeholders to create a Software Requirement Specification (SRS) document.

3.Design: Phase 3.

Architecting the software layout, system interfaces, user interface (UI), and database schemas based on the requirements.

4.Implementation (Coding): Phase 4.

The actual software development phase where programmers write the source code using appropriate programming languages.

5.Testing: Phase 5.

Deploying the code into a testing environment to find, track, and fix bugs or performance defects.

6.Deployment & Maintenance: Phase 6.

Releasing the software into production for real users and performing ongoing updates, security patches, and optimizations.

2. Write 3 differences between Agile and Waterfall models.

ANS:

Feature	Agile Model	Waterfall Model
Approach	Iterative and incremental; project is broken down into small, continuous cycles.	Linear and sequential; each phase must finish completely before the next begins.

SESSION-4
MODULE-1(TASK)

Feature	Agile Model	Waterfall Model
Flexibility	Highly adaptable; changes in requirements are welcome at any stage of development.	Rigid; changing requirements after the initial planning phase is highly complex and costly.
Delivery	Frequent, working releases are delivered to the client every few weeks.	Single final delivery occurs at the very end of the entire project lifecycle.

3. Name the 3 main Scrum roles and write one line about the responsibility of each.

ANS:

- **Product Owner:** Responsible for maximizing the value of the product by managing the Product Backlog and ensuring the team aligns with stakeholder needs.
- **Scrum Master:** Responsible for establishing Scrum practices, clearing roadblocks for the team, and coaching them on Agile principles.
- **Developers (The Scrum Team):** The professionals who do the actual hands-on work to deliver a shippable increment of product functionality during each iteration.

4. What is a Sprint in Scrum? Mention its typical duration.

ANS:

In Scrum, a Sprint is a fixed, short iteration during which a development team works to complete a specific set of items from the product backlog. It represents a timebox where a usable, potentially releasable product increment is created.

Typical Duration: A sprint consistently lasts between 1 to 4 weeks, with 2 weeks being the most common industry standard.

5. What do these Jira board columns mean: To Do, In Progress, Done, Backlog?

ANS:

- **Backlog:** A holding area for all pending features, user stories, and tasks that need to be done eventually, but are not actively committed to the current work cycle.

SESSION-4

MODULE-1(TASK)

- **To Do:** The specific list of tasks that have been selected and committed for the active sprint, waiting for a developer to pick them up.
- **In Progress:** Tasks that are currently being worked on by a team member right now.
- **Done:** Tasks that have been fully completed, tested, and meet the team's strict "Definition of Done."
