

SESSION-2 (TASK)
MODULE-1

1. **What are the three main layers of software architecture? Write one line about each.**

ANS:

The Three Main Layers of Software Architecture

- **Presentation Layer (UI):** The outermost layer that users interact with, responsible for displaying data and capturing user inputs.
- **Application Layer (Business Logic):** The core brain of the software that processes data, enforces business rules, and coordinates data movement between the user interface and the database.
- **Data Layer (Storage):** The backend database or file system where application data is securely stored, retrieved, and managed.

2. **Define client and server in your own words with one real-life example.**

ANS:

Client: The device or application (like your laptop or a web browser) that requests a service, data, or resources.

Server: The powerful remote computer that listens for those requests, processes them, and sends back the appropriate response or data.

Real-Life Example: Think of ordering food at a restaurant. You (the customer) are the client placing an order, and the kitchen is the server that prepares the food and sends it back to your table.

3. **Write 2 differences each between desktop apps, web apps, and mobile apps.**

ANS:

SESSION-2 (TASK)
MODULE-1

Feature	Desktop Apps	Web Apps	Mobile Apps
Installation & Access	Installed directly onto a laptop or PC operating system (Windows, macOS).	Accessed instantly through any web browser without installation.	Downloaded and installed via an app store onto handheld devices (iOS, Android).
Offline Capability	Can typically run fully or partially offline without an internet connection.	Strictly require an active internet connection to load and function.	Often designed to work offline, utilizing local device storage.

4. Name any 3 databases and mention whether each is SQL or NoSQL.

ANS:

- **3 Popular Databases**
 - a. **MySQL: SQL (Relational)**
 - b. **MongoDB: NoSQL (Non-Relational)**
 - c. **PostgreSQL: SQL (Relational)**
